## 1 QUESTION

(CSIR-UGC-NET June 2015 Q 104) Let  $X$  and  $Y$  be random variables with joint cumulative distribution function  $F_{XY}(x, y)$ . Then which of the following conditions are sufficient for  $(x_0, y_0) \in \mathbb{R}^2$  to be a point of continuity of  $F_{XY}$ ?

- 1)  $p_{XY}(x = x_0, y = y_0) = 0$
- 2) Either  $p_{XY}(x = x_0) = 0$  or  $p_{XY}(y = y_0) = 0$ .
- 3)  $p_{XY}(x = x_0) = 0$  and  $p_{XY}(y = y_0) = 0$ .
- 4)  $p_{XY}(x = x_0, y \leq y_0) = 0$   
and  $p_{XY}(x \leq x_0, y = y_0) = 0$ .

## 2 ANSWER

Let  $F_{XY}(x, y)$  be joint cumulative distribution function and  $P_{XY}(x, y)$  be joint probability distribution function.

From the definition of cumulative distribution function

$$pdf = \frac{d}{dx}cdf$$

$$P(x) = \frac{d}{dx}F(x)$$

or

$$F(x) = \int_{x=-\infty}^x P(x) dx \quad (2.0.1)$$

$$\Rightarrow F_{XY}(x, y) = \int_{y=-\infty}^y \int_{x=-\infty}^x p_{XY}(x, y) dx dy \quad (2.0.2)$$

**Lemma 2.1.**  $F_{XY}(x, y)$  is continuous at  $(x_0, y_0)$  iff  $p_{XY}(x, y)$  is defined in the regions

- 1)  $-\infty < x < x_0, y = y_0$
- 2)  $x = x_0, -\infty < y < y_0$
- 3) point  $(x_0, y_0)$

*Proof.* For  $F$  to be continuous at  $(x, y)$

$$\lim_{k \rightarrow 0} \lim_{h \rightarrow 0} (F_{XY}(x_0 + h, y_0 + k) - F_{XY}(x_0, y_0)) = 0 \quad (2.0.3)$$

$$\begin{aligned} \lim_{k \rightarrow 0} \lim_{h \rightarrow 0} & \int_{y=-\infty}^{y_0+k} \int_{x=-\infty}^{x_0+h} p_{XY}(x, y) dx dy \\ & - \int_{y=-\infty}^{y_0} \int_{x=-\infty}^{x_0} p_{XY}(x, y) dx dy = 0 \end{aligned} \quad (2.0.4)$$

On expanding the limits of integrals we get

$$\begin{aligned} \lim_{k \rightarrow 0} \lim_{h \rightarrow 0} & \int_{y=y_0}^{y_0+k} \int_{x=-\infty}^{x_0} p_{XY}(x, y) dx dy \\ & + \int_{y=-\infty}^{y_0} \int_{x=x_0}^{x_0+h} p_{XY}(x, y) dx dy \\ & + \int_{y=y_0}^{y_0+k} \int_{x=x_0}^{x_0+h} p_{XY}(x, y) dx dy = 0 \end{aligned} \quad (2.0.5)$$

Which is zero if  $p_{XY}(x, y)$  is defined over the integrating region i.e  $p_{XY}(x, y)$  should be defined over the integrating region of

1)

$$\lim_{k \rightarrow 0} \lim_{h \rightarrow 0} \int_{y=y_0}^{y_0+k} \int_{x=-\infty}^{x_0} p_{XY}(x, y) dx dy$$

2)

$$\lim_{k \rightarrow 0} \lim_{h \rightarrow 0} \int_{y=-\infty}^{y_0} \int_{x=x_0}^{x_0+h} p_{XY}(x, y) dx dy$$

3)

$$\lim_{k \rightarrow 0} \lim_{h \rightarrow 0} \int_{y=y_0}^{y_0+k} \int_{x=x_0}^{x_0+h} p_{XY}(x, y) dx dy$$

The integrating regions tend to be equal to

- 1)  $-\infty < x < x_0, y = y_0$
- 2)  $x = x_0, -\infty < y < y_0$
- 3) point  $(x_0, y_0)$

Let these be regions 1,2,3 respectively

$\Rightarrow P(X, Y)$  should be defined over regions 1,2,3. i.e

- 1)  $p_{XY}(-\infty < x < x_0, y = y_0)$
- 2)  $p_{XY}(x = x_0, -\infty < y < y_0)$
- 3)  $p_{XY}(x, y)$  should be defined

□

Now let's verify the options

- 1) Option 1 defines  $p_{XY}(x, y)$  only in region 3 but not 1, 2.

**Counter-example:-**

Let's consider an example similar to dirac-delta function.

$$\begin{aligned} P_{XY}(x, y) &= \infty & (x, y) &= (x_0, y_1) \text{ where } y_1 < y_0 \\ &= 0 & \text{otherwise} \end{aligned} \quad (2.0.6)$$

Here  $P_{XY}(x, y)$  is 0 still  $F_{XY}$  is not continuous at  $(x_0, y_0)$  parallel to X-axis

$$\begin{aligned} F_{XY}(x, y) &= 1 & x > x_0, y > y_1 \\ &= 0 & \text{otherwise} \end{aligned} \quad (2.0.7)$$

**So option 1 is false**

- 2) Option 2 defines  $p_{XY}(x, y)$  only in region 3 and either region 1 or region 2.

If we take the same example in equation 2.0.6 it satisfies  $p_{XY}(Y = y) = 0$  i.e option 2 but  $F_{XY}$  is not continuous at  $(x, y)$ .

**So option 2 is also false**

*Another counter example is:-*

$$\begin{aligned} P_{XY}(x, y) &= \infty & (x, y) &= (x_1, y_0) \text{ where } x_1 < x_0 \\ &= 0 & \text{otherwise} \end{aligned} \quad (2.0.8)$$

This is also a function similar to dirac-delta function

- 3) Option 3 defines  $p_{XY}(x, y)$  in all three regions.

**So option 3 is true**

- 4) Option 4 also defines  $p_{XY}(x, y)$  in all three regions.

**So option 4 is also true**

**Hence correct options are 3, 4.**
